

Kali Linux Fix Notes (KDE / SDDM Issue)

Date

Today

Problem Summary

After removing XFCE from Kali Linux:

- Login screen showed **session selection (Plasma select page)**
 - Then **autologin got enabled**
 - Login UI became **broken / split screen**
 - KDE login theme not working properly
-

Root Causes

1. XFCE removal removed some GUI components
 2. Default session was not properly set
 3. SDDM config misconfigured
 4. Login theme (Breeze) missing or broken
 5. Autologin accidentally enabled
-

Fix Steps

✓ 1. Reinstall GUI Core & KDE

```
sudo apt install xorg kde-standard sddm --reinstall
```

✓ 2. Set Default Session

```
sudo update-alternatives --config x-session-manager
```

Select:

```
/usr/bin/startplasma-x11
```

✓ 3. Fix SDDM Config

Edit config:

```
sudo nano /etc/sddm.conf
```

Set:

```
[General]
Session=plasma11.desktop

[Theme]
Current=breeze
```

✗ Remove Autologin (Important)

Delete this if exists:

```
[Autologin]
User=hridoy
Session=plasma11.desktop
```

✓ 4. Reinstall Theme

```
sudo apt install sddm-theme-breeze --reinstall
```

✓ 5. Restart Display Manager

```
sudo systemctl restart sddm
```

OR

```
sudo reboot
```

Final Result

- KDE Plasma loads by default 
- No session selection screen 
- Login page with password works 
- Clean KDE Breeze theme restored 

Debug Commands

Check sessions:

```
ls /usr/share/xsessions/
```

Check user config:

```
cat ~/.dmrc
```

Notes

- Do NOT remove `xorg` unless you know what you're doing
- Always keep at least one desktop environment working
- SDDM is default for KDE — don't replace unless needed

Conclusion

System is now stable with:

- KDE Plasma (only)
- Proper login screen
- Clean configuration
